# Chapter 1: Introduction

Thank you for purchasing Promise Technology's FastTrak S150 TX4 RAID controller card. The PC which you are using either already contains FastTrak S150 TX4 installed by a third-party or you have acquired a FastTrak S150 TX4 retail product for your existing PC and plan to install the card yourself.

- For PC owners wishing to install their FastTrak S150 TX4 RAID controller card, go to Chapter 2: Installation on page 5.
- For PCs with a FastTrak S150 TX4 RAID controller card already installed, and you are experiencing any difficulties with the hard drive being recognized by the card go to the Chapter 6: Troubleshooting on page 51.
- If your operating system has crashed for some reason or you have downloaded updated drivers from the Promise website ([www.promise.com](http://www.promise.com)), you may wish to reinstall software drivers for the FastTrak S150 TX4 RAID controller card. See Chapter 4: Installing Drivers on page 33.

## ***FastTrak S150 TX4***

Promise originally designed the FastTrak S150 TX4 as a cost-effective, high performance RAID controller card that adds performance and/or reliability to PC desktops and/or servers using Serial ATA drives.

FastTrak S150 TX4 has three independent data channels to support a maximum of four Serial ATA drives. FastTrak S150 TX4 supports:

- Striping (RAID 0) – Identical drives can read and write data in parallel to increase performance.
- Mirroring (RAID 1) – Mirroring increases read performance through load balancing and elevator sorting while creating a complete backup of your files.
- Striping / Mirroring (RAID 0+1) – Combining striping with mirroring offers both high read/write performance and fault tolerance

A FastTrak S150 TX4 striped array can double the sustained data transfer rate of Serial ATA drives.

FastTrak S150 TX4 offers fault tolerant, data redundancy for entry-level network file servers or simply for desktop PC users wanting to continually protect valuable data on their PC. Each model offers RAID 1 mirroring (for two drives) and RAID 0+1 mirroring plus striping (for four drives) to protect data.

Should a drive that is part of a mirrored array fail, FastTrak S150 TX4 uses the mirrored drive (which contains identical data) to assume all data handling. When a new replacement drive is later installed, FastTrak S150 TX4 rebuilds data to the new drive from the mirrored drive to restore fault tolerance.

FastTrak S150 TX4 bootable BIOS supports individual drives larger than 137 GB. With FAT32 and NTFS partitioning, the array can be addressed as one large single volume.

## ***Promise Array Management Utility (PAM)***

The Promise Array Management (PAM) utility offers local and remote management and monitoring of all FastTrak arrays that exist anywhere on a network. Windows-based GUI provides email notification of all major events/alarms, memory cache management, logging for NT/2000 servers, array maintenance, rebuild, and access to all components in array (server, controller, data channels, individual drives, and enclosure). For information on using PAM, refer to the PAM User Manual, which is included on the CD that came with your FastTrak S150 TX4. Or download it from the Promise website.

## Key Features and Benefits

The following information offers an overview of the major features of your new Promise FastTrak S150 TX4.

<b>Advanced Hardware Design</b>	
<b>Features</b>	<b>Benefits</b>
Supports 66MHz PCI bus motherboards (automatically backward compatible with 33MHz PCI slots)	Allows maximum data transfers of up to 266MB per second (133 MB/s in 33 MHz slot) over the bus to dramatically reduce the time to save and retrieve large files.
Supports: data striping (RAID 0), mirroring (RAID 1), and striping/mirroring (RAID 0+1)	Provides dramatic increase in drive performance and/or fault tolerant options. Offers performance customization and data rebuilds from the BIOS menu.
Supports Serial ATA Specification	Burst data transfer rates up to 150MB/sec from Serial ATA drives to boost overall system performance.
Independent data channels for Serial ATA drives	Drives can multiply their data transfer performance when striped together and each drive uses a separate data channel.
PCI Plug-n-Play, PCI Interrupt sharing and coexists with motherboard IDE and SCSI controllers	Easy to install; supports 4 Serial ATA drives on the FastTrak S150 TX4 while still supporting 4 devices on motherboard ATA controller.
Supports concurrent ATA channel operation	Drive workload is distributed in parallel between members of the array.
Supports bus master operation	Allows multitasking during disk transfers that increase CPU efficiency. The CPU is free to process tasks during data transfers through the PCI Bus to/from system memory.
Utilizes FastBuild™ automenu from the FastTrak S150 TX4 onboard BIOS	Has “Auto Setup” option for quick and easy array builds.
Displays status and error checking messages during bootup	Notifies user of possible errors and allows for recovery of mirrored drive arrays directly from FastBuild™.

Employs the latest Promise PCI Serial ATA ASIC technology	Fully supports Serial ATA specifications with 150 MB/sec timing and CRC error-checking at high speeds.
Mirroring supports automatic background rebuilds	Fault tolerance can be restored automatically without rebooting.

<b>Compatibility</b>	
<b>Features</b>	<b>Benefits</b>
Complies with PCI v2.3 Local Bus standard	Provides highest level of hardware compatibility.
Complies with SATA Specification 1.0	Provides full compatibility with first generation Serial ATA hard drives.
Compliant with PCI Bus Master standard. PCI Bus Master support	Provides 32-bit I/O and Bus Master performance for optimal system performance.
Tested compatibility to coexist with motherboards that have integrated IDE controllers	Improves system performance of new and existing installations.
Features LBA and Extended Interrupt13 drive translation in controller onboard BIOS	Breaks capacity barriers for support of drives greater than 137 GB in capacity. Offers flexible storage options for space demanding applications.

## Chapter 2: Installation

This section is designed to quickly get your FastTrak S150 TX4 Serial ATA RAID controller card up and running using the default settings, which will be optimal for most users.

If you wish to modify any of the default settings, please refer to Chapter 3, page 15, Using FastBuild™ Configuration Utility.

### ***Unpacking Your FastTrak Card***

When you receive the FastTrak S150 TX4 card, the package should contain the items listed below:

- FastTrak S150 TX4 RAID Controller Card
- Quick Start Guide
- FastTrak S150 TX4 driver diskette
- Four internal 4-wire Serial ATA hard drive data cables
- One Y power splitter cable
- CD with Drivers, Promise Array Management (PAM) utility, PAM User Manual and FastTrak S150 TX4 User Manual

If ANY of the contents are missing or appear to be damaged, please contact your dealer or distributor immediately.

---

#### **Warning**

Before installing the adapter into an existing system, backup any important or useful data. Failure to follow this accepted PC practice could result in data loss.

---

---

#### **Warning**

The FastTrak S150 TX4 Serial ATA RAID Controller card, like other parts of your system, is subject to damage by static electricity. Be sure that you're properly grounded (Promise recommends that you wear an anti-static strap or touch a grounded object) and that you unplug your system before installing FastTrak.

---

## ***Installing the FastTrak Card***

The FastTrak TX4 Serial ATA RAID card fits into any available PCI slot on your PC's motherboard (see Figure 1, below):

- 32-bit PCI slot (must be PCI 2.2 or 2.3 compliant)
  - The 32-bit portion of a 64-bit PCI slot
1. Remove the cover of your system.
  2. Remove the inside slot cover of an available 32-bit PCI slot on the motherboard.
  3. Install the FastTrak Serial ATA RAID card into the open slot (see Figure 1 below). Secure the bracket to the system's frame.
  4. Attach your system case's 2- or 4-pin LED cable to the LED connector on the FastTrak S150 TX4 RAID card (see Figure 2, on page 8). Make sure that pin 1 on the connector is aligned with pin 1 of the cable.
  5. Fasten the controller card bracket to the system case (see below).

**Figure 1.** Insert the FastTrak card into an open PCI slot

## Installing the Hard Drives

---

### Important

---

If you wish to include your current bootable Serial ATA drive using the Windows NT 4.0, Windows 2000, or Windows XP operating system as part of a bootable Mirrored (RAID 1) array on your FastTrak Serial ATA RAID card, do NOT connect the hard drive to the FastTrak yet.

You MUST install the Windows NT4, 2000, or XP driver software first onto this drive while it is still attached to your existing hard drive controller.

---

The FastTrak Serial ATA RAID card supports up to four Serial ATA hard drives. For optimal performance, install four identical Serial ATA drives of the same model and capacity. The drives' matched performance allows the array to function better as a single drive.

If you are striping (RAID 0) for performance, use up to four new drives. If mirroring (RAID 1) for protection, you can use two new drives OR use an existing drive and a new drive (the new drive must be the same size or larger than the existing drive).

1. Install the hard drives into the hard drive bays of your system, including the power cables.

---

### Caution

---

Use of removable hard drive enclosures other than Promise Technology's SuperSwap is not supported and may result in performance loss or other undesired results.

---

2. Attach one Serial ATA data cable to each hard drive. Then attach the other ends of the cables to the connectors on the FastTrak Serial ATA RAID card.

**Figure 2. FastTrak S150 TX4 card**

3. Attach the Y-cable power splitters to the Serial ATA hard drives.

**Note**

The FastTrak S150 TX4 RAID controller is a PCI Plug-n-Play (PnP) device. No changes are necessary in the Motherboard CMOS Setup for resources or drive types in most applications.

## Creating Your Disk Array

You will now use the onboard FastBuild™ BIOS utility to create your array using the attached drives. There are three different scenarios in creating this array. You can create an array for:

- Performance
- Security, using new hard drives (recommended)
- Security, using an existing hard drive and a new one
- Security, using Quick Initialization

The first three steps are the same for all three choices. After that, follow the steps for the array you want to create.

1. Boot your system. If this is the first time you have booted with the FastTrak S150 TX4 card and drives installed, the Promise onboard BIOS will display the following screen.

```
FastTrak S150 TXx (tm) BIOS Version 1.aa (Build xxxx)
(c) 2002-2005 Promise Technology, Inc. All Rights Reserved
```

```
No array defined . . .
```

```
Press <Ctrl-F> to ender FastBuild (tm) Utility
Or press <ESC> key to continue booting the system
```

2. Press the Ctrl-F keys to display the FastBuild Utility Main Menu.
3. Press "1" to display the Auto Setup Menu below. This is the fastest and easiest method to creating your first array.

```
FastBuild (tm) Utility 2.xx_(c) 2002-2005 Promise Technology, Inc.
[Auto Setup Options Menu]

Optimize Array for:                               Performance

[ Auto Setup Configuration ]

Mode ..... Stripe
Spare Drive ..... 0
Drives used in Array ..... 2
Array Disk Capacity ..... 160048

[ Keys Available ]

[↑] Up [↓] Down [←, →, Space] Change Option [ESC] Exit [Ctrl-Y] Save
```

## Creating a Performance Array

Use this setting to create a Striped (RAID 0) array. FastTrak S150 TX4 enables you to create striped arrays with 1, 2, 3, or 4 drives. These arrays have no fault tolerance.

To create an array for best performance, follow these steps:

1. Press the Spacebar to choose *Performance* under the Optimize Array for section.
2. Press Ctrl-Y to Save and create the array.
3. Reboot your system.
4. Once the array has been created, you will need to FDISK and format the array as if it were a new single hard drive.
5. Once the arrayed drives have been formatted, proceed to Chapter 4 of this Manual to install your operating system and/or FastTrak driver.

## Creating a Security Array with New Drives

Use this setting to create a Mirrored (RAID 1) array with two new hard drives. If one of the drives has data on it, follow the *Creating a Security Array with an Existing Data Drive* procedure on the next page.

### Note

When creating a Security array with new drives, a feature called Gigabyte Boundary will automatically be set to ON. For a description of this feature, see page 23 in the User Manual.

To create an array for data protection using new hard drives, follow these steps:

1. Press the Spacebar to choose *Security* under the Optimize Array for section.
2. Press Ctrl-Y to Save your selection.
3. The window below will appear.

Do you want the disk image to be duplicated to another or do quick initialize or create only?  
Y - Create and Duplicate  
N - Create Only  
I - Create and Quick Initialize

4. Press N for the Create Only option.
5. A window will appear almost immediately confirming that your Security array has been created. Press any key to reboot the system.

Array has been created.  
<Press Any Key to Reboot>

6. Proceed with normal FDISK and format procedures as if you had just installed a new hard drive.
7. Once the arrayed drives have been formatted, proceed to Chapter 4 of this Manual to install your operating system and/or FastTrak driver.

## Creating a Security Array with an Existing Data Drive

Use this setting to create a Mirrored (RAID 1) array with a new hard drive and an existing drive with data and/or the bootable system drive in your system. Use a new drive of identical or larger storage capacity as the existing drive.

---

### Warning

---

If you are creating a Security array using an existing hard drive, backup any important data. Failure to do so could result in data loss.

---

---

### Important

---

If you wish to include your current bootable drive using the Windows NT 4.0, Windows 2000, or Windows XP operating system as part of a bootable Mirrored (RAID 1) array on your FastTrak S150 TX4, do NOT connect the hard drive to the FastTrak yet.

You MUST install the Windows NT4, 2000, or XP driver software first to this drive while it is still attached to your existing hard drive controller. See chapter 4 of this Manual.

---

Follow these steps:

1. Press the Spacebar to choose *Security* under the Optimize Array for section.
2. Press Ctrl-Y to Save your selection. The window below will appear.

Do you want the disk image to be duplicated to another or do quick initialize or create only?

Y - Create and Duplicate

N - Create Only

I - Create and Quick Initialize

3. Press Y for the Create and Duplicate option. The window below will appear asking you to select the Source drive to use. FastBuild will copy all data from the Source drive to the Target drive.

Channel:ID	Source Disk Drive Model	Capacity (MB)
----	----	----
Channel:ID	Target Disk Drive Model	Capacity (MB)
----	----	----
[Please Select A Source Disk]		
Channel:ID	Drive Model	Capacity (MB)
1 :	SEAGATE S380023AS	80024
2 :	SEAGATE S380023AS	80024
[↑] Up [↓] Down [ESC] Exit [Ctrl-Y] Save		

4. Use the arrow keys to choose which drive contains the existing data to be copied.
5. Press Ctrl-Y to Save selection and start duplication. The following progress screen will appear.

Start to duplicate the image . . .  
 Do you want to continue? (Yes/No)  
 Y – Continue N - Abort

6. Select Y to continue. If you choose N, you will be returned to step 1.
7. Once complete, the following screen will appear confirming that your Security array has been created. Press any key to reboot the system.

Array has been created.  
 <Press Any Key to Reboot>

8. Once the arrayed drives have been formatted, proceed to Chapter 4 of this Manual to install your operating system and/or FastTrak driver.

## Creating a Security Array with Quick Initialization

Use this setting to create a Mirrored (RAID 1) array with one or two existing hard drives containing data that you do *not* want to keep. This method creates a mirrored array and erases the first data block from your existing drives.

---

### Warning

Using the Quick Initialization option on existing drives will result in the loss of all data on those drives.

---

---

### Note

When creating a Security array with new drives, a feature called Gigabyte Boundary will automatically be set to ON. For a description of this feature, see page 23 in the User Manual.

---

Follow these steps:

1. Press the Spacebar to choose *Security* under the Optimize Array for section.
2. Press Ctrl-Y to Save your selection.
3. The window below will appear.

Do you want the disk image to be duplicated to another or do quick initialize or create only?  
Y - Create and Duplicate  
N - Create Only  
I - Create and Quick Initialize

4. Press I for the Create and Quick Initialize
5. A window will appear almost immediately confirming that your Security array has been created. Press any key to reboot the system.

Array has been created.  
<Press Any Key to Reboot>

6. Proceed with normal FDISK and format procedures as if you had just installed a new hard drive.
7. Once the arrayed drives have been formatted, proceed to Chapter 4 of this Manual to install your operating system and/or FastTrak driver.

# Chapter 3: Using FastBuild Configuration Utility

The FastBuild Configuration Utility offers several menu choices to create and manage the drive array on the Promise FastTrak S150 TX4 RAID Controller card. For purposes of this manual, it is assumed you have already created an array in the previous chapter and now wish to make a change to the array or view other options.

## Viewing FastTrak S150 TX4 BIOS Screen

When you boot your system with the FastTrak S150 TX4 card and drives installed, the Promise onboard BIOS will detect the drives attached and show the following screen.

```
FastTrak S150 TXx (tm) BIOS Version 1.xx (Build xxxx)
(c) 2002-2005 Promise Technology, Inc. All Rights Reserved.

ID      MODE  SIZE  TRACK-MAPPING  STATUS
1 *     2+0 Stripe  160048M  611/128/32  Functional

Press <Ctrl-F> to enter FastBuild (tm) Utility....
```

If an array exists already, the BIOS will display the above screen showing the card's BIOS version and status of the array.

The array status consists of five possible conditions: *Functional*, *Synchronizing*, *Rebuilding*, *Critical*, and *Offline*.

**Functional** – The array is operational.

**Synchronizing** – The process of verifying data integrity by recalculating redundant data and matching the data on the disk drives

**Rebuilding** – The process of reconstructing an array in Critical mode by placing redundant data on a replacement disk drive.

**Critical** – Degraded array condition due to a failed or removed disk drive. Applies to mirrored arrays (RAID 1 and 0+1) only. Fault tolerance is lost but the data is still accessible. Triggers automatic rebuilding.

**Offline** – Striped arrays (RAID 0): Degraded array condition due to one failed or removed disk drive. The data is not accessible.

Mirrored arrays (RAID 1 and 0+1): Degraded array condition due to two failed or removed disk drives. Fault tolerance is lost. The data is not accessible.

If your array goes Offline, contact Promise Technical Support for assistance. See Appendix B.

## Navigating the FastBuild Setup Menu

When using the menus, these are some of the basic navigation tips: Arrow keys highlights through choices; the Space bar allows to cycle through options; Enter selects an option; Esc aborts or exits the current menu.

## Using the Main Menu

This is the first option screen when entering the FastBuild Setup.

To create a new array automatically, follow the steps under *Creating Arrays Automatically* on page 17. Promise recommends this option for most users.

To manually create an array, see *Manually Creating an Array* on page 21.

You will also need to manually create an array if you wish to modify block size.

To view drives assigned to arrays, see *Viewing Drive Assignments* on page 20.

To delete an array (but not delete the data contained on the array), see *Deleting an Array* on page 28.

To rebuild a mirrored array, see *Rebuilding a Mirrored Array* on page 30.

### Notes

---

After you install the FastTrak S150 TX4 card and configure an array using FastBuild, use FDISK to format the arrayed drive(s) if you are using new, blank drives

---

## Creating Arrays Automatically

The Auto Setup (1) selection from the Main Menu can intuitively help create your disk array. It will assign all available drives appropriate for the disk array you are creating. After making all selections, press Ctrl-Y to Save the selections. FastBuild will automatically build the array.

```

FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc.
[Auto Setup Options Menu]

Optimize Array for:           Performance

[ Auto Setup Configuration ]

Mode.....Stripe
Spare Drive Count ..... 1
Drives used in Array ..... 2
Array Disk Capacity (size in MB) ..... 160048

[ Keys Available ]

[↑] Up [↓] Down [←, →, Space] Change Option [ESC] Exit [Ctrl-Y] Save

```

### Optimize Array for

Select whether you want Performance (RAID 0), Security (RAID 1 or RAID 0+1) under the Optimize Array for setting.

#### Performance

RAID 0 (Striping) supports the high performance. The storage capacity equals the number of drives times the capacity of the smallest drive in the disk array.

**Note**

---

FastTrak S150 TX4 permits striped arrays using 1, 2, 3, or 4 drives attached in Auto Setup mode.

Under the Security setting, FastTrak S150 TX4 permits two drives to be used for a single Mirrored array or four drives to be used for a Mirrored/Striped array in Auto Setup.

---

**Security**

(RAID 1 Mirroring, or RAID 0+1 Striping/ Mirroring) creates a mirrored (or fault tolerant) array for data security. The storage capacity equals one-half the number of drives times the capacity of the smallest drive in the disk array.

**Note**

---

Under the Security setting, FastTrak S150 TX4 permits two drives to be used for a single Mirrored array or four drives to be used for a Mirrored/Striped array in Auto Setup.

---

**Security and Performance**

RAID 0+1 (Striping/Mirroring) creates an array with striping for high performance plus mirroring for fault tolerance and data security. The storage capacity equals the number of drives times the capacity of the smallest drive in the disk array. This option requires 4 drives.

## Using a Hot Spare Drive

If a third drive is attached and is not assigned to a mirrored two-drive disk array (one optimized for Security), it will be recognized as a spare drive. Such a drive is immediately used as a standby replacement. It is automatically added to an array once a disk member of the array has been detected as failed.

To restore fault tolerance as quickly as possible, FastTrak S150 TX4 begins to perform an automatic data rebuild on the spare drive in the background without the need to restart the system.

At a later time, the failed drive can be physically removed from the FastTrak S150 TX4 card and an extra drive added in its place to function as the spare drive.

---

### Important

---

The hot spare drive must have a capacity that is equal to or larger than the smallest array member.

---

## Creating Multiple Arrays

If you plan to create multiple arrays,

1. Attach only the drives necessary to create the first disk array and complete the Auto Setup (1).
2. Install the additional drives needed for the second array and again use the Auto Setup (1).

---

### Note

---

If you wish to customize the settings of individual disk arrays (such as block size), you must manually create disk arrays with the Define Array (3) option from the Main Menu.

---

## Viewing Drive Assignments

The View Drive Assignments (2) option in the Main Menu displays whether drives are assigned to a disk array or are unassigned.

Under the Assignment column, drives are labeled with their assigned disk array or shown as Free if unassigned. Such Free drives can be used for a future array or used as a spare drive when a drive fails in a mirrored array, provided the free drive's capacity is equal to or larger than the smallest array member.

Unassigned drives are not accessible by the OS. The menu also displays the data transfer mode that relates to speed used by each drive (U5 refers to 100MB/sec transfers, U4 refers to 66MB/sec transfers, etc...)

FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc.					
[ View Drive Assignments ]					
Channel:ID	Drive Model	Capacity(MB)	Assignment	Mode	
1 :	SEAGATE S380023AS	80024	Array 1	U	
2 :	SEAGATE S380023AS	80024	Array 1	U	
3 :	SEAGATE S380023AS	80024	Free	U	
4 :	SEAGATE S380023AS	80024	Free	U	
[ Keys Available ]					
[↑] Up [↓] Down [ESC] Exit Mode (U=UDMA, D=DMA)					

## Manually Creating an Array

The Define Array (3) option from the Main Menu allows users to begin the process of manually defining the drive elements and RAID levels for one or multiple disk arrays attached to FastTrak S150 TX4.

Users will commonly create one or two drive arrays with FastTrak S150 TX4, though the card will support a maximum of four arrays. You may use a single drive in striping mode with FastTrak S150 TX4. In this rare scenario, the card will create an individual array ID but will offer conventional controller performance depending on the drive type. At a later time, you can add a second drive to the array and recreate the array to support RAID 1 mirroring.

### Note

For most installations, Promise recommends the (1) Auto Setup for easy disk array creation.

FastBuild (tm) Utility 2.xx (c) 2002-2005\_Promise Technology, Inc.  
[Define Array Menu]

Array No	RAID Mode	Total Drv	Capacity(MB)	Status
Array 1	Stripe	2	160048	Functional
Array 2	---	---	---	---
Array 3	---	---	---	---
Array 4	---	---	---	---

[ Keys Available ]

[↑] Up [↓] Down [ESC] Exit [Enter] Select

To manually create an array from the Define Array Menu:

1. Press the arrow keys to highlight the array number you wish to define, and press Enter to select.
2. The Define Array Definition Menu will next appear that allows drive assignments to the disk array (see next page).

## Selecting Array Type

1. Under the Definition section of this menu, highlight the Array # for which you want to assign a RAID level.
  2. Press the Spacebar to cycle through three array types:
    - Performance (RAID 0 Striping)
    - Security (RAID 1 Mirroring)
    - RAID 0+1 Striping/Mirroring (for 4 drives)
- See page 45 for more information about RAID levels.

```
FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc.
[ Define Array Definition Menu ]

Array No      RAID Mode      Total Drv      Status
Array 1      Stripe        2              Functional

Stripe Block: 64 KB                      Gigabyte Boundary: ON
                                [ Drive Assignments ]

Channel:ID      Drive Model      Assignment
1 :             SEAGATE S380023AS  Y
2 :             SEAGATE S380023AS  Y
3 :             SEAGATE S380023AS  N
4 :             SEAGATE S380023AS  N

[↑] Up [↓] Down [ESC] Exit [Space] Select [Ctrl-Y] Save
```

## Selecting Stripe Block

For RAID 0 and RAID 0+1 arrays you may manually select the stripe block size. Press the Spacebar to scroll through choices progressing as follows (16, 32, 64, 128 KB).

The size selected affects how FastTrak S150 TX4 sends and retrieves data blocks to and from the drives. You will need to perform your own testing to determine how the data block size is affecting your particular use of the array. In general, a larger block size is better when handling large data transfers (such as in A/V editing or graphics) while a smaller block size is better when handling e-mail and other common server data. The default is 64KB.

## Gigabyte Boundary

The Gigabyte Boundary feature is designed for mirrored arrays (RAID 1 or RAID 0+1) in which a drive has failed and the user cannot replace the drive with the same capacity or larger. Instead, the Gigabyte Boundary feature permits the installation of a replacement drive that is slightly smaller (within 1 gigabyte) than the remaining working drive (for example, an 80.5 GB drive would be rounded down to 80 GB).

This can be helpful in the event that a drive fails and an exact replacement model is no longer available. Without this feature enabled, FastTrak S150 TX4 will NOT permit the use of a replacement drive that is slightly smaller than the remaining working drive.

For the Gigabyte Boundary feature to work, the Gigabyte Boundary feature must be set to ON when the original mirrored array is created. When enabled, the Gigabyte Boundary feature rounds the drive capacity of both drives to the common whole GB drive size. For example, with the Gigabyte Boundary feature enabled, the remaining working drive can be 80.5 GB and the replacement drive can be 80.3, since both are rounded down to 80GB.

This permits the smaller drive to be used. Please note that users will lose a small amount of available storage capacity from both drives in order to arrive at a common drive size.

### Note

Gigabyte Boundary is automatically disabled when creating a mirrored array (RAID 1) from an existing drive (versus using two brand new drives). This protects the existing drive's partition table in order to maintain data integrity.

## Assigning Drive(s) to Array

1. Under the Drive Assignments section, highlight a drive by pressing the ↑ and ↓ keys.
2. Press the Spacebar to change the Assignable option to Y to add the drive to the disk array.
3. Press Ctrl-Y to save the disk array information. Depending on the array type selected, the following scenarios will take place:
  - If choosing a Striping or Mirroring/Striping array, the initial Define Array Menu screen will appear with the arrays defined. From there you may ESC to exit and return to the Main Menu of FastBuild.
  - If you selected a Mirroring array for two drives, there is an additional window that appears as described in order to create the array. To do this you will use either two brand new drives, or one drive that contains existing data that you wish to mirror.

## Creating a Striped Array

As described in the Drive Assignments Option section above, if you selected a performance array, follow the directions here.

1. Set the Stripe Block size. 64 KB is the default.
2. Assign new drives to the Performance array.

You may assign from one to four drives. If you assign only one drive, there will be no performance benefit

3. Save the information by pressing Ctrl-Y. You will return to the Define Array Menu.

Your system will reboot when you exit the FastBuild Utility.

## Creating a Mirrored Array Using New Drives

As described in the Drive Assignments Option section above, if you selected a mirroring array and wish to use two new assigned drives, follow the directions here.

1. Assign new drives to a Mirroring array
2. Save the information by pressing Ctrl-Y, the window below will appear.

Do you want the disk image to be duplicated to another or do quick initialize or create only?  
Y - Create and Duplicate  
N - Create Only  
I - Create and Quick Initialize

3. Press N for the Create Only option. A window will appear almost immediately confirming that your Security array has been created.

Array has been created.  
<Press Any Key to Reboot>

4. Press any key to reboot the system.

## Adding Fault Tolerance to an Existing Drive

FastTrak S150 TX4 will create a mirrored array using an existing system drive with data. You must assign the existing drive and another drive of same or larger capacity to the Mirroring array. The BIOS will send the existing data to the new blank drive.

### Warning

Backup any necessary data before proceeding. Failure to follow this accepted PC practice could result in data loss.

### Important

If you wish to include your current bootable drive using the Windows NT 4.0, 2000 or XP operating system as part of a bootable Mirrored (RAID 1) array on your FastTrak S150 TX4, You **MUST** install the driver software while the bootable drive is still attached to your existing hard drive controller. See Chapter 4.

1. Assign the drives to a Mirroring array.
2. Press Ctrl-Y to Save your selection. The window below will appear.

Do you want the disk image to be duplicated to another or do quick initialize or create only?

Y - Create and Duplicate  
 N - Create Only  
 I - Create and Quick Initiate

### Note

Gigabyte Boundary is automatically disabled when creating a mirrored array (RAID 1) from an existing drive (versus using two brand new drives). This protects the existing drive's partition table in order to maintain data integrity.

3. Press Y for the Create and Duplicate option. The window below will appear asking you to select the Source drive to use. FastBuild will copy all data from the Source drive to the Target drive.

Channel:ID	Source Disk Drive Model	Capacity (MB)
Channel:ID	Target Disk Drive Model	Capacity (MB)
[Please Select A Source Disk]		
Channel:ID	Drive Model	Capacity (MB)
1 :	SEAGATE S380023AS	80024
2 :	SEAGATE S380023AS	80024
[↑] Up [↓] [ESC] Exit [Ctrl-Y] Save		

- Press the arrow keys to choose which drive contains the existing data to be copied.

**Warning**

All target drive data will be erased. Make sure you choose the correct drive.

- Press Ctrl-Y to Save selection and start duplication. The following confirmation screen will appear.

Start to duplicate the image . . .  
 Do you want to continue? (Yes/No)  
 Y – Continue N – Abort

- Select Y to continue. If you choose N, you will be returned to step 1.
- Once you select Y, the following progress screen will appear. The process will take a few minutes.

Please Wait While Duplicating The Image

10%

Complete

Once mirroring is complete, the following screen will appear confirming that your Security array has been created.

Array has been created.  
<Press Any Key to Reboot>

8. Press any key to reboot the system.

## Creating a Hot Spare Drive for Mirrored Arrays

For automatic rebuilds of a mirrored array, attach a spare drive to the FastTrak S150 TX4. Drives that are not assigned to an array and are the same size or larger than the original will be used for the automatic rebuild. This is performed in the background under all supported operating systems, except DOS. At a later time, the system can be turned off and the failed drive can be physically removed.

## How FastTrak S150 TX4 Orders Arrays

During startup, the disk arrays on the FastTrak S150 TX4 are recognized in this order:

1. The array set to bootable in the FastBuild Setup.
2. The Array number (i.e. Array 0, Array 1...). This would be involved in determining which drive letters will be assigned to each disk array.

## How FastTrak S150 TX4 Saves Array Information

All disk array data is saved into the reserved sector on each array member. Promise suggests that users record their disk array information for future reference.

Another feature of the FastTrak S150 TX4 disk array system is to recognize drive members even if drives are moved between different FastTrak S150 TX4 card connectors. Since each drive's array data identifies itself to the array, it is possible to move or swap drives without modifying the array setup. This is valuable when adding drives, or during a rebuild.

## Deleting an Array

The Delete Array (4) Menu option allows for deletion of disk array assignments. This is not the same as deleting data from the drives themselves.

---

### Important

---

If you delete an array by accident, immediately define a new array identical to one you deleted. This action normally recovers the deleted array.

---

---

### Warning

---

Deleting an existing disk array could result in its data loss. Make sure to record all array information including the array type, the disk members, and stripe block size in case you wish to undo a deletion.

---

FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc.  
[ Delete Array Menu ]

Array No	RAID Mode	Total Drv	Capacity(MB)	Status
Array 1	Stripe	2	160048	Functional
Array 2	Mirror	2	80024	Functional
Array 3	---	---	---	---
Array 4	---	---	---	---

[ Keys Available ]

[↑] Up [↓] Down [ESC] Exit [Del] Delete

1. To delete an array, highlight the Array you wish to delete and press the Delete key.
2. The Array Definition menu will appear (see below) showing which drives are assigned to this array.

```
FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc.
[ Define Array Menu ]

Array No      RAID Mode      Total Drv      Capacity(MB)      Status
Array 1      Stripe         2              160048            Functional

Stripe Block: 64 KB                               Gigabyte Boundary: OFF
[ Drive Assignments ]

Channel:ID      Drive Model      Capacity (MB)      Assignment
1 :             SEAGATE S380023AS  80024              Y
2 :             SEAGATE S380023AS  80024              Y
```

Press Ctrl-Y to confirm Yes to the following warning message and continue array deletion:

```
Are you sure you want to delete this array?
Press Ctrl-Y to Delete, others to Abort
```

After deleting the array, create a new array using Auto Setup or the Define Array menu from the FastBuild Main Menu.

## Rebuilding a Mirrored Array

The Rebuild Array (5) Menu option can be used to recover from an error in a mirrored disk array. You will receive an error message when booting your system from the FastTrak BIOS.

### Important

Drives **MUST** be replaced if they contain any physical errors.

Follow these steps before using the Rebuild Array menu option:

1. On bootup, the FastTrak S150 TX4 Startup BIOS will display an error message identifying which drive has failed.
2. Press Ctrl-F to enter FastBuild Main Menu.
3. Select submenu Define Array (3).
4. Select the failed array and identify the Channel and ID of the failed drive.
5. Power off and physically remove the failed drive.
6. Replace the drive with an identical model.
7. Reboot the system and enter the FastBuild Main Menu.
8. Select the Rebuild Array (5) option. The following screen will appear.

FastBuild (tm) Utility 2.xx (c) 2002-2005 Promise Technology, Inc. [ Rebuild Array Menu ]				
Array No	RAID Mode	Total Drv	Capacity(MB)	Status
Array 1	Stripe	2	160048	Functional
Array 2	Mirror	2	80024	Critical
Array 3	---	---	---	---
Array 4	---	---	---	---

[ Keys Available ]

[↑] Up [↓] Down [ESC] Exit [Enter] Select

9. Highlight the array whose Status is Critical.
10. Press Enter. The following screen will then appear (see next page).

# Chapter 4: Installing Software Drivers

Following are driver installation procedures for the Windows operating systems that support the FastTrak S150 TX4 Controller. The FastTrak TX4 software drivers for Windows are included on the driver diskette.

Drivers and installation instructions for other Operating Systems are downloadable from the Promise website at [www.promise.com](http://www.promise.com).

## Important

---

If you wish to include your current bootable Serial ATA drive using the Windows NT4.0, Windows 2000, or Windows XP operating system on your FastTrak S150 TX4 Controller card, you **MUST** install the Windows driver software first onto this drive while it is still attached to your existing hard drive controller.

## ***New Windows XP Installation***

The following details the installation of the FastTrak TX4 drivers while installing Windows XP.

1. Start the installation:
  - Floppy Install: Boot the computer with the Windows XP installation diskettes.
  - CD-ROM Install: Boot from the CD-ROM. Press F6 after the message "Press F6 if you need to install third party SCSI or RAID driver" appears.
2. When the Windows XP Setup window is generated, press S to specify an Additional Device(s).
3. Insert the FastTrak TX4 driver diskette into drive A: and press Enter.
4. Choose *WinXP Promise FastTrak TX4000/S150 TX Series Controller* from the list that appears on screen, and then press the Enter.
5. Press S to use the driver on the floppy disk and then press Enter to continue with installation.
6. The Windows XP Setup screen will appear again saying "Setup will load support for the following mass storage devices:" The list will include "WinXP Promise FastTrak TX4000/S150 TX Series Controller".

NOTE: If there are any additional devices to be installed, specify them now. When all devices are specified, continue to the next step.
7. From the Windows XP Setup screen, press the Enter. Setup will now load all device files and then continue the Windows XP installation.

## ***Existing Windows XP Installation***

After installing the FastTrak S150 TX4 card and rebooting your system, Windows XP setup will show a “Found New Hardware” dialog box. Under Windows XP, “Mass Storage Controller” will be displayed.

1. Insert the FastTrak TX4 driver diskette into the A:\ drive.
2. Choose *Install the software automatically* and press the Enter key.
3. Choose *WinXP Promise FastTrak TX4000/S150 TX Series Controller* from the list that appears on screen, and then press the Enter key.
4. If using a driver that has not been digitally signed by Microsoft, you will be asked if you want to continue the installation. Click Continue anyway.
5. When the New Hardware Wizard has finished installing the FastTrak TX4 software, click Finish.

## ***Confirming Windows XP Driver Installation***

1. Right-click on the My Computer icon and select Manage from the popup menu.
2. From the left panel, select Device Manager.
3. Click the “+” in front of SCSI controllers. “WinXP Promise FastTrak TX4000/S150 TX Series Controller” should appear.

## ***New Windows 2000 Installation***

The following details the installation of the FastTrak TX4 drivers while installing Windows 2000.

1. Start the installation:
  - Floppy Install: Boot the computer with the Windows 2000 installation diskettes.
  - CD-ROM Install: Boot from the CD-ROM. Press F6 after the message "Press F6 if you need to install third party SCSI or RAID driver" appears.
2. When the Windows 2000 Setup window is generated, press S to specify an Additional Device(s).
3. Insert the FastTrak TX4 driver diskette into drive A: and press Enter.
4. Choose *Win2000 Promise FastTrak TX4000/S150 TX Series Controller* from the list that appears on screen then press Enter.
5. The Windows 2000 Setup screen will appear again saying "Setup will load support for the following mass storage devices:" The list will include "Win2000 Promise FastTrak TX4000/S150 TX Series Controller".

NOTE: If there are any additional devices to be installed, specify them now. When all devices are specified, continue to the next step.
6. From the Windows 2000 Setup screen, press Enter. Setup will now load all device files and then continue the Windows 2000 installation.

## ***Existing Windows 2000 Installation***

After installing the FastTrak S150 TX4 card and rebooting your system, Windows 2000 setup will show a "New Hardware Found" dialog box. Under Windows 2000, "PCI Mass Storage Controller" will be displayed.

1. Choose *Add New Hardware Wizard* from the list, and then press Enter.
2. Choose *Add/Troubleshoot a device* and click Next. The new hardware wizard will show device list
3. Choose *Mass Storage controller* and click Next. At the following screen click Finish.
4. Choose *Display a list the known drivers for this device so that I can choose a specific driver* then click Next.
5. When the Windows 2000 supported SCSI adapter drivers list appears, click Have disk.
6. Insert the FastTrak TX4 driver diskette in drive A:\.
7. Type **A:\Win2000** in the text box. Click OK.
8. Choose *Win2000 Promise FastTrak TX4000/S150 TX Series Controller* from the list that appears on screen, then click Next.
9. Click Yes to confirm continue the installation and copy the driver to system.
10. Remove the diskette and click Finish to restart the system. Windows 2000 will then restart for the driver installation to take effect.

## ***Confirming Windows 2000 Driver Installation***

1. Right-click on the My Computer icon and select Manage from the popup menu.
2. From the left panel, select Device Manager.
3. Click the "+" in front of SCSI controllers. "Win2000 Promise FastTrak TX4000/S150 TX Series Controller" should appear.

## ***New Windows ME Installation***

The following details the installation of the FastTrak TX4 drivers while installing Windows ME.

1. Install the FastTrak TX4 controller card into your system.
2. Install Windows ME fully.
3. After installation, go to the Start menu and choose Settings.
4. From the Settings menu, choose Control Panel.
5. In the Control Panel window, double-click the System icon.
6. In the System window, choose the Device Manager tab.
7. In the hierarchical display under Other Devices is a listing for PCI RAID Controller. Click it then click the Properties button.
8. In the Properties window, choose the Driver tab then choose Update Driver and click Next.
9. Choose Search for a better driver than the one your device is using now (recommended) then click Next.
10. Choose Specify Location then type **A:\WIN98-ME** in the text box.
11. Insert the FastTrak TX4 driver diskette into the A: drive.
12. Click the Next button. A message informing you that "Win98-ME Promise FastTrak TX4000/S150 TX Series Controller" should appear.
13. Click Next, then click Finish.
14. When asked if you want to restart your computer, click Yes. Immediately remove the diskette from drive A:.

## ***Existing Windows ME Installation***

The following section details the installation of FastTrak TX4 drivers on a system that has Windows ME already installed and running.

1. After installing the FastTrak S150 TX4 controller card and configuring the hard drives, power up the system and boot.
2. The Add New Hardware Wizard will appear, informing you that it has found a PCI Mass Storage Controller.
3. Click Next, then from the generated list box, choose *Specify the location of the driver (Advanced)*.
4. Click Next, then from the generated choices, choose *Specify a location*.
5. Insert the FastTrak TX4 driver diskette in drive A:.
6. Type **A:\WIN98-ME** in the text box that appears.
7. Click Next. A message informing you that Windows Me has found “Win98-ME Promise FastTrak TX4000/S150 TX Series Controller” should appear.
8. Click Next, then click Finish. When asked if you want to restart your computer, click Yes. Immediately remove the diskette from drive A:.

## ***Confirming Windows ME Driver Installation***

To confirm that the driver has been properly loaded in Me, perform the following steps:

1. Choose *Settings* from the Start menu.
2. Choose *Control Panel*, then double-click the System icon.
3. Choose the *Device Manager* tab, then click the “+” in front of SCSI & RAID controllers. “Win98-ME Promise FastTrak TX4000/S150 TX Series Controller” should appear.

## ***New Windows NT4.0 Installation***

The following details the installation of the FastTrak TX4 drivers while installing Windows NT4.0.

1. Start the system installation by booting from the Windows NT disk:
  - Floppy install: boot the system with the Windows NT installation diskettes.
  - CD-ROM disk install: boot from the CD-ROM disk and press F6 when the message "Setup is inspecting your computer's hardware configuration..." appears.
2. When the Windows NT Setup window is generated, press S to Specify an Additional Device(s).
3. Press O to select *Other* then press Enter.
4. Insert the FastTrak TX4 driver diskette into drive A: and press Enter.
5. Choose *WinNT Promise FastTrak TX4000/S150 TX Series Controller* from the list that appears on screen then press Enter.
6. The Windows NT Setup screen will appear again saying "Setup will load support for the following mass storage devices:" The list will include "WinNT Promise FastTrak TX4000/S150 TX Series Controller".

NOTE: If there are any additional devices to be installed, specify them now. When all devices are specified, continue to the next step.
7. From the Windows NT Setup screen, press Enter. Setup will now load all device files and then continue the Windows NT installation.
8. After a successful installation, the SCSI Adapter Setup box will show that the "WinNT Promise FastTrak TX4000/S150 TX Series Controller" driver has been installed.

## ***Existing Windows NT4.0 Installation***

The following section details the installation of FastTrak TX4 drivers on a system that has Windows NT4.0 already installed and running.

NOTE: Do not attach the boot drive or any other hard drive to the FastTrak TX4 controller card before completing this step.

1. From the Start menu, choose Settings.
2. From the Settings menu, choose Control Panel.
3. Double-click the SCSI Adapters icon. The SCSI Adapters dialog box appears.
4. Choose Drivers then click Add.
5. In the Install Drivers dialog box, click Have Disk...
6. When Install From Disk appears, insert the FastTrak TX4 driver diskette in drive A:.
7. Type **A:\NT4** in the text box window then click OK.
8. When the Install Driver dialog box appears, select *WinNT Promise FastTrak TX4000/S150 TX Series Controller* then click OK.
9. When the Select SCSI Adapter Option dialog box appears, click Install.
10. After a successful installation, the SCSI Adapter Setup box will show that the "WinNT Promise FastTrak TX4000/S150 TX Series Controller" has been installed.
11. Power off your system.
12. If you plan to move the boot drive to the FastTrak card, do it now. Otherwise reboot.

## ***Removing Driver from Windows NT4.0***

1. From Start, choose Setup then choose Control Panel.
2. In Control Panel, choose SCSI Adapter then choose Drivers.
3. Click the Remove button.
4. After successful removal, the SCSI Adapter Setup box will show that the "WinNT Promise FastTrak TX4000/S150 TX Series Controller" has been removed.

## ***New Windows 98 Installation***

The following section details the installation of the FastTrak TX4 drivers while installing Windows 98.

1. Install the FastTrak S150 TX4 controller card and configure the hard drive(s), partition and format your hard drive(s), if necessary.
2. Install Windows 98 normally.
3. After installation, go the Start menu and choose Settings.
4. From the Settings menu, choose Control Panel.
5. In the Control Panel window, double-click the System icon.
6. In the System window, choose the Device Manager tab.
7. In the hierarchical display under Other Device is a listing for PCI RAID Controller. Select it then click the Properties button.
8. Choose the Driver tab in the Properties window, choose Update Driver then click Next.
9. Choose Search for a better driver than the one your device is using now (recommended), then click Next.
10. Choose Specify Location then type **A:WIN98-ME** in the text box.
11. Insert the FastTrak TX4 driver diskette into the A: drive.
12. Click the Next button. A message informing you that "Windows 98 has found Win98-ME Promise FastTrak TX4000/S150 TX Series Controller" should appear.
13. Click Next, then Finish.
14. When asked if you want to restart your computer, click Yes. Immediately remove the diskette from drive A:.

## ***Existing Windows 98 Installation***

The following section details the installation of FastTrak TX4 drivers on a system that has Windows 98 already installed and running.

1. After installing the FastTrak S150 TX4 controller card and configuring the hard drives, power up the system and boot Windows.
2. The “Add New Hardware Wizard” will appear, informing you that it has found a “PCI Mass Storage Controller.”
3. Click Next. From the generated list box, choose *Search for best driver for your device (Recommended)*.
4. Click Next. From PCI Mass Storage Controller choose *Finish*.
5. Insert the FastTrak TX4 driver diskette in drive A:.
6. Click Next. From the generated choices, choose *Specify a location*.
7. Type **A:\WIN98-ME** in the text box that appears.
8. Click Next. A message informing you that Windows has found “Win98-ME Promise FastTrak TX4000/S150 TX Series Controller” should appear.
9. Click Next, then click Finish.
10. Click Yes when asked if you want to restart your computer. Be sure to eject the diskette from drive A:.

## ***Confirming Windows 98 Driver Installation***

To confirm that the driver has been properly loaded in Windows 98, perform the following steps:

1. Choose *Settings* from the Start menu.
2. Choose *Control Panel*, then double-click the System icon.
3. Choose the *Device Manager* tab, then click the “+” in front of SCSI controllers. “Win98-ME Promise FastTrak TX4000/S150 TX Series Controller” should appear.

# Chapter 5: Disk Array Concepts

## **About FastTrak S150 TX4**

FastTrak S150 TX4 is a high performance Serial ATA/Ultra ATA RAID controller card that features concurrent data channel operation and onboard BIOS. The channels on the FastTrak S150 TX4 support concurrent operation that allows for overlapped I/O under multi-tasking operating systems and sharing the workload between multiple drives.

## **About Adapter BIOS**

The FastTrak S150 TX4 card contains a BIOS code that extends the standard disk service routine provided through Int13. The BIOS is bootable for DOS and other operating systems that rely on the system BIOS for drive operation. When the FastTrak S150 TX4 BIOS appears during bootup, press Ctrl-F to enter the FastBuild setup to select from menu settings.

## **FastBuild Auto Menu Setup**

This setup utility is used to build and manage FastTrak S150 TX4 disk arrays. The utility is menu driven and features the Auto Setup (1) option that uses a simple, interactive setup process. Once the array is built, all the array members store the configuration information in the drive's reserved area. See Chapter 3, which provides descriptions of individual functions.

## **Reserve Sector**

Array configuration data about the drive member and other members in the disk array are saved on a special location on the disk drives called the *reserve sector*. If any member of the array becomes corrupt or lost, the redundant configuration data on the other members can be used for rebuilds.

Disk array members do not have a memory of their drive positions. This allows drives to be placed on different FastTrak S150 TX4 connectors or cards within the system without reconfiguring or rebuilding.

## Disk Array Terms

### Disk Array Description

A disk array is formed from a group of two or more disk drives that appear to the system as a single drive. The advantage of an array is to provide better throughput performance and/or data fault tolerance.

Better performance is accomplished by sharing the workload among multiple physical drives.

Fault tolerance is achieved through data redundancy operation where if one (or more) drive fails or has a sector failure, a mirrored copy of the data can be found on another drive(s).

For optimal results, select identical Ultra ATA/133 drives or Serial ATA drives to install in disk arrays. The drives' matched performance allows the array to function better as a single drive.

### Disk Array Member

The individual disk drives in an array are called members. Each member of a specific disk array has coded in its reserved sector configuration information that identifies the drive as a member. All disk members in a formed disk array are recognized as a single physical drive to the system.

### Disk Array Types

For most installations, the FastBuild setup Auto Setup (1) option will configure your system.

There are three disk array types (**RAID 0, 1, and 0+1**) in two categories that can be installed on the FastTrak S150 TX4 card. Striping is in the Performance category while Mirroring and Striping/Mirroring are in the Fault Tolerance category.

Disk arrays within the Performance and Fault Tolerance categories conform to the Redundant Array of Independent Disks technology, or RAID. The RAID levels supported are 0, 1, and 0+1.

RAID Level	Performance	Fault Tolerance	Capacity	No. of Drives
RAID 0 (Striping)	Highest	No	No. Drives x Smallest Size	2 to 4
RAID 1 (Mirroring)	Normal	Yes	Smallest Size Drive	2
RAID 0+1 (Stripe/Mirror)	High	Yes	2X Smallest Size Drive	4

## About RAID Levels

### Striping (RAID 0)

Reads and writes sectors of data interleaved between multiple drives. When any disk member fails, it affects the entire array. Performance is better than a single drive since the workload is balanced between the array members.

This array type is for high performance systems. Identical drives are recommended for performance as well as data storage efficiency. The disk array data capacity is equal to the number of drive members times the smallest member capacity. For example, one 100 GB and three 120 GB drives will form a 400 GB (4 x 100 GB) disk array.

**Stripe Size** – A value can be set from 16KB to 128KB sector size. The size can directly affect performance. In the FastBuild BIOS, the default is 64KB.

Disk Drives

## Mirroring (RAID 1)

Writes duplicate data on to a pair of drives while reads are performed in parallel. ATA RAID 1 is fault tolerant because each drive of a mirrored pair is installed on separate IDE channels. If one of the mirrored drives suffers a mechanical failure (for example, spindle failure) or does not respond, the remaining drive will continue to function. This is called Fault Tolerance. If one drive has a physical sector error, the mirrored drive will continue to function.

Disk Drives

On the next reboot, the FastBuild™ Utility will display an error in the array and recommend replacing the failed drive. Users may choose to continue using their PC, however Promise recommends replacing the failed drive as soon as possible.

Due to redundancy, the drive capacity of the array is half the total drive capacity. For example, two 100 GB drives that have a combined capacity of 200 GB would have 100 GB of usable storage. With drives of different capacities, there may be unused capacity on the larger drive.

**Using a Spare Drive** – Under a RAID 1 setup, an extra hot spare drive. You can attach a third drive to the FastTrak S150 TX4 without assigning it to the array. Such a drive will be activated to replace a failed drive that is part of a mirrored array. A rebuild takes place automatically in the background to mirror the good drive data on to the spare.

At a later time, the system can be powered off and the failed drive can be physically removed and replaced. Spare drives must be the same or larger capacity than the smallest array member.

## Striping / Mirroring (RAID 0+1)

A combination of RAID 0 and RAID 1 arrays. It can increase performance by reading and writing data in parallel while protecting data with duplication. A minimum of four drives are required.

With a four-drive disk array, two pairs of drives are striped. Each pair mirrors the data on the other pair of striped drives. The data capacity is similar to a standard Mirroring array with half of total capacity dedicated for redundancy.

## About Dual Data Redundancy

One unique (though rarely occurring) feature of RAID 0+1 is dual fault tolerance. In some cases, two drives can fail simultaneously yet the array still maintains the integrity of data. There are six combinations in which two of the four drives can fail. FastTrak S150 TX4 protects the data array in four of those cases.

Assume the drives are configured as follows:

- CH indicates channels on the FastTrak S150 TX4 card.
- A/B indicates which striped pair the drive belongs to.
- 1/2 indicates which part of stripe data.

CH 1	CH 2	CH 3	CH 4
Drive A1	Drive A2	Drive B1	Drive B2

Under RAID 0+1, the array maintains data integrity if any 1, 2 combination survives.

Event	Failed Drives	Array Status	Why?
1	A1/A2	Functional	B1/B2 retain array integrity
2	B1/B2	Functional	A1/A2 retain array integrity
3	A1/B2	Functional	B1/A2 retain array integrity
4	B1/A2	Functional	A1/B2 retain array integrity
5	A1/B1	Offline	B2/A2 contain only half of array data
6	B2/A2	Offline	A1/B1 contain only half of array data

# Chapter 6: Troubleshooting & Tips

This section is used to assist with troubleshooting conflicts and FastTrak S150 TX4 installation problems. Also refer to the README.TXT file on the FastTrak S150 TX4 driver and utility diskette for more recent information as well as the PromiseOnline services listed in Appendix B.

The section is divided into the following categories: Motherboard Issues, System CMOS Issues, Drive Errors, Operating System Errors, and Audio/Video Editing Tips.

## Motherboard Issues

### Freeing additional IRQ resources

Since the Promise card supports PCI Interrupt sharing, it is possible to use IRQs already assigned to another PCI card. Interrupt Sharing is not supported with onboard IDE controllers. If the onboard IDE controller(s) are not used, you may disable the controllers to free IRQ 14 and/or 15.

### Configuring PCI IRQ resources

Setting the IRQ for a particular PCI slot will be different depending on the motherboard BIOS. This setting is usually made in the PCI Configuration and/or Plug and Play (PnP) section of the motherboard BIOS setup. There are three common methods that motherboard BIOS's handle assignment of IRQs to PCI slots:

- Specifically assigning an IRQ to a particular slot - You can tell the motherboard to use IRQ 10 for PCI slot 1, IRQ 11 for PCI slot 2, etc.
- Listing which IRQs are available to be assigned to the PCI slots - This BIOS has an option where you specify 1st Available IRQ, 2nd Available IRQ, etc. The BIOS then scans the PCI slots for PCI cards and assigns these IRQs in the order that it finds the PCI cards.

Consult your motherboard manual for information that is specific to your motherboard.

### Intermittent data problems

Overclocking the PCI bus may cause the system to hang or data corruption. If you experience either of these problems and you are overclocking the PCI bus, set the PCI bus back to its normal setting to see if this is causing the errors.

## System CMOS Issues

### **Set Motherboard CMOS Boot sequence to boot to FastTrak S150 TX4**

On some Motherboard BIOS, it is necessary to set the Boot sequence to SCSI, A:, C: since the Promise card is identified as a SCSI card.

### **Motherboard CMOS displays C: or D: drive failure during startup**

See the Drive-Related Errors section.

### **Using an Onboard IDE Card with FastTrak S150 TX4**

If an onboard IDE controller is installed with hard disks, enable support in the Motherboard Standard CMOS Setup for the drives. Note that the onboard IDE hard drives will then be the bootable hard disk unless the system BIOS has a boot sequence setting with the option to specify booting to a different device.

## Drive-Related Errors

### Critical Array Status Error Reported during Boot

If a critical status error message appears on the FastTrak S150 TX4 BIOS startup screen for a mirrored array (see below), there is a drive in the array that has failed or is not responding. FastTrak S150 TX4 will identify the failed drive by channel number. The mirrored array has lost its fault tolerance, but will still perform normal drive reads and writes.

Operation aborted because FastBuild encountered an error as follows:

Location: Channel 2  
Array Status: Critical

Please retry using Promise Array Management utility to recover all data. Reboot the system by pressing the ENTER key.

Try powering the system off and on to reset the drive. Also confirm that cables are properly attached and the drive is receiving power. If the drive still appears to have failed, refer to the Rebuilding an Array option in the Promise Array Management (PAM) utility as detailed in the PAM User Manual.

### Drive cannot be formed into an array

Drives must support Serial ATA and be free of media defects to be added into an array. Promise recommends using new identical drives for each array. Re-secure data and power cabling while checking for proper alignment. Typically, Pin 1 of the drive is closest to the power connector.

### System CMOS displays C: or D: drive failure during Startup

Do not reference C: or D: in the Motherboard Standard CMOS for drives attached to the FastTrak S150 TX4 controller. Only enter drive information in the Motherboard CMOS for drives attached to the onboard IDE controller.

### FDISK reports a much lower drive capacity if a single physical drive or a striped array exceeds 64GB

Due to a limitation with FDISK, the utility reports only the storage capacity that exceeds 64GB. This is a cosmetic, not actual, limitation. Simply create a single DOS drive partition, reboot, and then format the partition. The Format command will recognize the total capacity of the partition accurately. Windows NT/2000/98 will now recognize the total capacity of your array.

## Unable to Partition or Format Array

This condition may occur when the Reserve Sector of one of the drives has become corrupt or bad. Removing the Reserve Sector will remedy any issue related directly to a Bad Reserve Sector.

---

### Warning

---

Before removing the Reserve Sector of the drive(s), backup any existing data. Removal of the reserve sector of any drive permanently deletes all existing data on the hard drive.

---

For Mirrored arrays (RAID 1), remove the Reserve Sector from the mirrored drive first (this will appear during Step 3 below) then rebuild the mirrored array. Remove the Sector on the Master Drive only as a last resort.

For Striped arrays (RAID 0), removing the Reserve Sector from any of the drives that are striped will destroy the arrayed data.

To remove the Reserve Sector, follow these steps:

1. During boot up, press Ctrl-F to enter the FastBuild BIOS utility.
2. Choose option 2, View Drive Assignments.
3. Press arrow keys to highlight the drive where you wish to remove the reserve sector.
4. Press Alt-F1. The highlighted drive will start blinking on the screen.
5. Press Ctrl-Tab. A message will appear that says the reserved sector (which is where array information is kept) on the disk will be wiped.
6. Press Y to confirm.
7. Take the appropriate action:
  - For striped arrays, repeat this process for each member of the particular array that is having a problem. When you are finished, press the Esc key twice to reboot.
  - For mirrored arrays, hit the Esc key twice to reboot.
8. After rebooting, use FastBuild to re-create the array.
  - For striped arrays, use FDISK and FORMAT after setting up the array.
  - For mirrored arrays, rebuild the mirrored array.

**Array Constantly Goes Into Critical or Offline Mode During Reboot**

See *Unable to Partition or Format array*, above.

**Cannot Rebuild Mirrored (RAID 1) Array**

See *Unable to Partition or Format array*, above.

**Fatal Errors or Data Corruption Are Constantly Reported When Reading or Writing to Drive Array**

See *Unable to Partition or Format array*, above.

## Operating System-Related Issues

### Different drive lettering under Windows NT

This may happen when using a SCSI card in addition to the Promise card. Windows NT does not necessarily load the driver for the boot device controller first. This results in a drive that in MS-DOS is the C: drive being the D:, or E:, etc. in Windows NT. Use the Windows NT Disk Administrator utility to reassign the letters that NT has improperly assigned to the drives. See your Windows NT documentation for instructions on how to use Disk Administrator.

### **The Operating System no longer boots after creating a Mirrored Array using your existing boot drive using Windows 98/NT4/2000/XP**

This is due to Drive Geometry issues. You can verify this if you move the original drive back to the onboard controller and it boots successfully. Each controller can view a drive differently. This can be an issue for a new controller that loads the original Master Boot Record (MBR) and then has a problem translating it or the Operating System boot record.

For Windows NT, Windows 2000, and Windows XP, Promise recommends a clean install of the Operating System. This action restores the MBR and OS boot record. This requires repartitioning and formatting the drive.

For Windows 98, you can perform the DOS Command SYS C: from a bootable floppy or CD-ROM to restore the operating system boot record and transfer the system files to the boot drive. If this does not work, the Windows 98 registry may have become corrupted during the boot process and must be restored. See the Windows documentation to perform this procedure.

### **Promise Windows driver does not appear in Device Manager**

Windows may already be listing the controller under Other Devices instead of the Hard disk controllers section. In Device Manager under Other Devices to see if it lists a PCI Card or RAID Controller. If so, highlight this listing and click on the Properties button then click on the Driver tab. Depending on your version of Windows, choose either Change Driver or Update Driver. Follow the on-screen prompts to complete installation of the driver. If Windows asks if you want to test if the device can be removed safely, click on CANCEL. Reboot the system to complete installation of the driver.

### **“Inaccessible Boot Device” Message Appears During Floppyless Install of Windows NT, 2000, or XP**

The F6 key was not pressed at the appropriate time. Reboot the system, and press the F6 key when the message “Setup is inspecting your computer’s hardware configuration...” appears in Windows NT4 or the message “Press F6 if you need to install third party SCSI or RAID driver” appears in Windows 2000.

### **“No Hard Drives Found” Message Appears During CD-ROM Install of Windows NT, 2000, or XP**

The F6 key was not pressed at the appropriate time. Reboot the system, and press the F6 key when the message “Setup is inspecting your computer’s hardware configuration...” appears in Windows NT4 or the message “Press F6 if you need to install third party SCSI or RAID driver” appears in Windows 2000 and XP.

## Performance Tips

Here are some tips that may optimize performance in a RAID 0 striped array. If you are using an audio/video-editing card, we also recommend reviewing your card's documentation for additional information.

### Use FastTrak S150 TX4 as D: or other non-bootable drive in a Striped Array

For Audio/Video editing, keep the original system boot drive on the standard IDE controller as C: drive. Partitioning software such as FDISK will see the array as one physical drive, D: or later. This will prevent file fragmentation and provide better accessibility to the array.

### Optimize Array for "Performance"

The Promise FastBuild BIOS Utility autoseup menu allows optimizing the array for Performance applications such as A/V Editing. The default Performance setting (Striping) selects a Stripe Block size of 64. This larger block size is recommended for the data streaming requirements of A/V editing. You may select an even larger block size in manual mode (see Chapter 3).

```
FastTrak (tm) / FastTrak S150 TX4 (tm) BIOS Version 1.xx (Build xxxx)
(c) 2002-2005 Promise Technology, Inc. All Rights Reserved.

[ Auto Setup Options Menu ]

Optimize Array for:           Performance

[ Auto Setup Configuration ]

Mode ..... Stripe
Stripe Block Size ..... 64
Drive used in Array ..... 2
Array Disk Capacity ..... 160048

[ Keys Available ]

[↑] Up [↓] Down  [←, →, Space] Change Option  [ESC] Exit  [Ctrl-Y] Save
```

## Change Setting of PCI Bus Utilization

Certain brands of video capture cards can produce a glitch on play back of .AVI files. A setting of Less for PCI Bus utilization reduces the time which FastTrak S150 TX4 occupies on the PCI bus and frees that time for use by other PCI devices and will eliminate the glitch dropout effect on playback.

1. In PAM, click on the Controller icon  in Tree View to display its Options in Information View.

2. At the bottom of the window is the PCI bus utilization slider.
3. Move the slider to the left to reduce the time FastTrak S150 TX4 occupies the PCI bus. Then click the Commit button.

Once a PCI bus setting has been selected, no reboot is required.

# Appendix A: Frequently Asked Questions

This section lists frequently asked questions involving pre-installation, drive issues, installation, and post-installation.

## ***Pre-Installation***

(Speed, Device Types, Capacity, Cabling)

---

Q: What kind of hard drives can I use for a FastTrak S150 TX4 array?

A: You can use any Serial ATA hard drive(s) to create arrays on the FastTrak S150 TX4. You should use matching drives for multiple-drive arrays to maximize capacity usage as well as performance.

---

Q: Will ACPI work with HDDs on the FastTrak S150 TX4?

A: Yes.

---

Q: Can I use ATAPI devices on the FastTrak S150 TX4 controller?

A: No. The FastTrak S150 TX4 controller does not support ATAPI devices.

---

Q: Will the FastTrak S150 TX4 work with 66MHz PCI bus speed?

A: Yes, the FastTrak S150 TX4 is designed to accommodate the newer PCI bus speed and is backward compatible with 33MHz speeds.

---

Q: How can I change the resources that the FastTrak uses?

A: The FastTrak S150 TX4 is fully PnP. This means all the resources that it uses are given to it by the PnP BIOS on the motherboard. The FastTrak S150 TX4 does support IRQ sharing, but this will not work unless ALL the concerned devices support the feature. If your motherboard allows you to control the assignment of these resources, you may be able to remedy the problem by:

Changing the IRQ assignments to the PCI slots in the motherboard BIOS during boot up.

Reset the configuration data in your CMOS. This is usually an option in the PnP section of your CMOS.

Otherwise, switch the FastTrak S150 TX4 card to a different PCI slot.

---

Q: How does the FastTrak S150 TX4 RAID controller provide storage and/or data protection with their arrays?

A: FastTrak S150 TX4 implements three different types of RAID levels as follows:

### **RAID 0 (Stripe)**

For capacity – The FastTrak S150 TX4 array will be as big as the smallest HDD in the array times however many HDDs are in the array. Any larger HDDs will simply be truncated. The truncated space on the bigger HDDs will then be unusable.

For sustained data transfers – Using FastTrak S150 TX4, a RAID 0 array consisting of two HDDs will transfer at about twice the speed of the slowest HDD in the array. A RAID 0 array consisting of four HDDs will transfer at about three times the speed of the slowest HDD in the array.

### **RAID 1 (Mirror)**

For capacity – The FastTrak S150 TX4 array will be as big as the smallest HDD in the array. The larger HDD will simply be truncated. The truncated space on the bigger HDD will then be unusable.

For sustained data transfers – The FastTrak S150 TX4 array will write data at the rate of the slowest HDD in the array. The FastTrak S150 TX4 array will read data at twice the rate of the slowest HDD in the array.

---

## ***Drive Issues***

---

Q: Can I add a drive to a FastTrak S150 TX4 RAID array via hot-swap and dynamically adjust the array size/configuration?

A: No. The FastTrak S150 TX4 system does not support dynamically adjustable RAID size/configurations.

---

Q: Do the HDDs on the FastTrak S150 TX4 have to be the same size?

A: The HDDs that you use with the FastTrak S150 TX4 do not have to be the same size. If the sizes differ, the FastTrak S150 TX4 will truncate the bigger HDD so the drives match. The resulting difference in HDD space is unusable, so avoid using HDDs of significantly different capacities.

---

Q: I already have an array on an older FastTrak controller. Can I move that array to my new FastTrak S150 TX4 controller?

A: Yes. All FastTrak controllers read the arrays the same way and can be moved from one controller to another.

---

Q: Can I take a drive used in a FastTrak S150 TX4 array and access it directly with a different controller, such as the one integrated on the motherboard?

A: Only Single-drive striped (RAID 0) and Mirrored (RAID 1) array configurations allow the drive(s) to be accessed individually on another controller. *Multiple*-drive striped (RAID 0) will not work.

---

Q: If I have a problem with one of the drives on the FastTrak S150 TX4, how can I low-level format it to correct the problem?

A: Do NOT do this. Low-level formatting IDE drives is unnecessary and generally does not correct problems commonly experienced during use.

Errors such as bad sectors or ECC/CRC failure are best remedied by completely replacing the drive. For this reason, do NOT low-level format the drives attached to the FastTrak S150 TX4 controller.

---

Q: Do I have to install disk management software on my array in order to access the full storage capacity of drives?

A: No! Disk management software will only complicate things. The array should be fully addressable by your OS as it is. Remember that some operating systems have varying limits on the sizes of partitions and logical drives that can be defined. Consult your OS documentation about partitioning larger drives.

---

Q: What system BIOS setup settings do I use for the drives on the FastTrak S150 TX4 controller?

A: None. The drives on the FastTrak S150 TX4 controller are supported by the FastTrak S150 TX4 BIOS and/or OS drivers, not by your system BIOS.

---

Q: How do I partition/format my FastTrak S150 TX4 RAID array?

A: The FastTrak S150 TX4 represents the array as a single HDD to your system. Therefore, anything that you can do to a single HDD you can do to a FastTrak S150 TX4 array. For example, you should use the FDISK and FORMAT utilities to partition/format the array. You can partition the array as you see fit. You can format the array with any file system you wish.

---

## ***Installation Issues***

(Capacity, Booting)

---

Q: Why are some drives recognized by the FastTrak S150 TX4 Array Setup utilities with only partial capacity?

A: Some hard drives ship with a jumper that reduces the addressable capacity of the drive to prevent problems with older systems that don't support larger drives. Consult your hard drive documentation to set the jumper so that you can use the full capacity of the drive.

---

Q: How can I change the system boot sequence in order to boot from the FastTrak S150 TX4 array?

A: The boot sequence is controlled by the system BIOS. As far as the system BIOS is concerned, the FastTrak S150 TX4 controller and defined arrays are categorized as a SCSI device. This allows you to set the boot sequence in your BIOS setup utility to boot from SCSI first, rather than IDE.

If there are multiple SCSI add-in controllers in the system, then the boot sequence among them will be determined exclusively by their PCI slot priority. PCI slot #1 will be first, slot #2 second, etc. Put the FastTrak S150 TX4 controller in the PCI slot where it will be accessed ahead of other SCSI controllers if you want to boot from the array.

---

Q: How can I change the boot sequence between a PCI SCSI card and the FastTrak S150 TX4 RAID array?

A: Since all PCI devices are PnP, it is difficult to determine which device is addressed first. Some newer motherboard BIOSes have advanced options that identify devices and allow you to select which device will be assigned resources first. Otherwise you may have to physically switch the device cards on the PCI slots so that the boot device is in the highest priority slot number (see previous question).

---

## ***Post-Installation***

---

Q: Why can't I see the drives on the FastTrak S150 TX4 under FDISK?

A: You have not created an array yet. If no array has been created, the system will not recognize drive(s) attached to the FastTrak S150 TX4.

---

# Appendix B: Technical Support

Promise Technical Support provides several support options for Promise users to access information and updates. We encourage you to use one of our electronic services, which provide product information updates for the most efficient service and support.

If you decide to contact us, please have the following information available:

- Product model and serial number
- BIOS and driver version numbers
- A description of the problem / situation
- System configuration information, including: motherboard and CPU type, hard drive model(s), IDE/ATAPI drives & devices, and other controllers.

## **Limited Warranty**

Promise Technology, Inc. ("Promise") warrants that for Three (3) years from the time of the delivery of the product to the original end user:

- a) the product will conform to Promise's specifications;
- b) the product will be free from defects in material and workmanship under normal use and service.

This warranty:

- a) applies only to products which are new and in cartons on the date of purchase;
- b) is not transferable;
- c) is valid only when accompanied by a copy of the original purchase invoice.
- d) is not valid on spare parts, fans, and power supplies.

This warranty shall not apply to defects resulting from:

- a) improper or inadequate maintenance, or unauthorized modification(s), performed by the end user;
- b) operation outside the environmental specifications for the product;
- c) accident, misuse, negligence, misapplication, abuse, natural or personal disaster, or maintenance by anyone other than a Promise or a Promise-authorized service center.

## **Disclaimer of other warranties**

This warranty covers only parts and labor, and excludes coverage on software items as expressly set above.

Except as expressly set forth above, Promise disclaims any warranties, expressed or implied, by statute or otherwise, regarding the product, including, without limitation, any warranties for fitness for any purpose, quality, merchantability, non-infringement, or otherwise. Promise makes no warranty or representation concerning the suitability of any product for use with any other item. You assume full responsibility for selecting products and for ensuring that the products selected are compatible and appropriate for use with other goods with which they will be used.

Promise does not warrant that any product is free from errors or that it will interface without problems with your computer system. It is your responsibility to back up or otherwise save important data before installing any product and continue to back up your important data regularly.

No other document, statement or representation may be relied on to vary the terms of this limited warranty.

Promise's sole responsibility with respect to any product is to do one of the following at its own discretion:

- a) replace the product with a conforming unit of the same or superior product;
- b) repair the product;
- c) recover the product and refund the purchase price for the product.

Promise shall not be liable for the cost of procuring substitute goods, services, lost profits, unrealized savings, equipment damage, costs of recovering, reprogramming, or reproducing of programs or data stored in or used with the products, or for any other general, special, consequential, indirect, incidental, or punitive damages, whether in contract, tort, or otherwise, notwithstanding the failure of the essential purpose of the foregoing remedy and regardless of whether Promise has been advised of the possibility of such damages. Promise is not an insurer. If you desire insurance against such damage, you must obtain insurance from another party.

Some states do not allow the exclusion or limitation of incidental or consequential damages for consumer products, so the above limitation may not apply to you.

This warranty gives specific legal rights, and you may also have other rights that vary from state to state. This limited warranty is governed by the State of California.

## **Your Responsibilities**

You are responsible for determining whether the product is appropriate for your use and will interface with your equipment without malfunction or damage. You are also responsible for backing up your data before installing any product and for regularly backing up your data after installing the product. Promise is not liable for any damage to equipment or data loss resulting from the use of any product.

## ***Returning Product for Repair***

If you suspect a product is not working properly, or if you have any questions about your product, contact our Technical Support Staff through one of our Technical Services, making sure to provide the following information:

- Product model and serial number (required);
- Return shipping address;
- Daytime phone number;
- Description of the problem;
- Copy of the original purchase invoice.

The technician will assist you in determining whether the product requires repair. If the product needs repair, the Technical Support Department will issue an RMA (Return Merchandise Authorization) number.

Return only the specific product covered by the warranty (do not ship cables, manuals, diskettes, etc.), with a copy of your proof of purchase to:

USA and  
Canada:

Promise Technology, Inc.  
Customer Service Dept.  
Attn.: RMA # \_\_\_\_\_  
1745 McCandless Drive  
Milpitas, CA 95035

Other Countries:

Return the product to your dealer or  
retailer.  
Contact them for instructions before  
shipping the product.

You must follow the packaging guidelines for returning products:

Use the original shipping carton and packaging or similar packaging if the original is not available:

- Include a summary of the product's problem(s)
- Write an attention line on the box with the RMA number
- Include a copy of proof of purchase

You are responsible for the cost of insurance and shipment of the product to Promise. Note that damage incurred due to improper transport or packaging is not covered under the Limited Warranty.

When repairing returned product(s), Promise may replace defective parts with new or reconditioned parts, or replace the entire unit with a new or reconditioned unit. In the event of a replacement, the replacement unit will be under warranty for the remainder of the original warranty term from purchase date, or 30 days, whichever is longer.

Promise will pay for standard return shipping charges only. You will be required to pay for any additional shipping options (such as express shipping).
